

It's prime time for a pool pump and motor replacement.

- \$200 cash rebate
- Save over \$400 annually on energy bills
- New pumps and motors run more quietly and last much longer than single-speed models
- Efficient daily filtration keeps pool water much cleaner and healthier

Savings Example

For an average-size pool with 20,000 gallons of water that needs cycling once a day:

- A single-speed motor takes 6 hours to cycle at an average cost of about \$870 per year.
- A variable-speed motor takes 12 hours at an average cost of about \$436 per year.

Pump Motor Type	Operating Hours	Avg. kWh Used Annually	Annual Cost to Operate
Single-Speed	6 Hours/Day	3,442	\$867.38
Variable-Speed	12 Hours/Day	1,730	\$435.96
TOTAL SAVINGS			\$431.42*

*Actual savings may vary based on actual pool size, equipment, and operating time.

For a rebate form and a list of qualifying equipment:

Visit www.sce.com/rebatesandsavings

Call (800) 736-4777

Rebates on qualifying models are offered on a first-come, first-served basis or until funding is expended, whichever occurs first. Installation must occur by December 31, 2008. Completed forms with required documentation must be postmarked by February 28, 2009. Incomplete applications cannot be processed. This program is funded by California utility ratepayers and administered by Southern California Edison Company under the auspices of the California Public Utilities Commission.

How is it possible to run a pool pump for twice as long and still save 50% in energy and money?

It takes far less energy to move the large amount of water in a pool slowly rather than quickly. You can liken it to driving a car at a slower speed. Although it may take more time to get to your destination driving 55 mph rather than 70 mph, you'll use 21% less gas.† Replacing a power-hungry, single-speed pool pump with a slower, more efficient variable-speed pump is simply a money-saving, energy-wise decision.
